## GENERAL DESCRIPTION

The XRT86VL30 is a single channel 1.544 Mbit/s or 2.048 Mbit/s DS1/E1/J1 framer and LIU integrated solution featuring $R^3$ technology (Relayless, Reconfigurable, Redundancy). The physical interface is optimized with internal impedance, and with the patented pad structure, the XRT86VL30 provides protection from power failures and hot swapping.

The XRT86VL30 contains an integrated DS1/E1/J1 framer and LIU which provides DS1/E1/J1 framing and error accumulation in accordance with ANSI/ ITU_T specifications. The framer has its own framing synchronizer and transmit-receive slip buffers. The slip buffers can be independently enabled or disabled as required and can be configured to frame to the common DS1/E1/J1 signal formats.

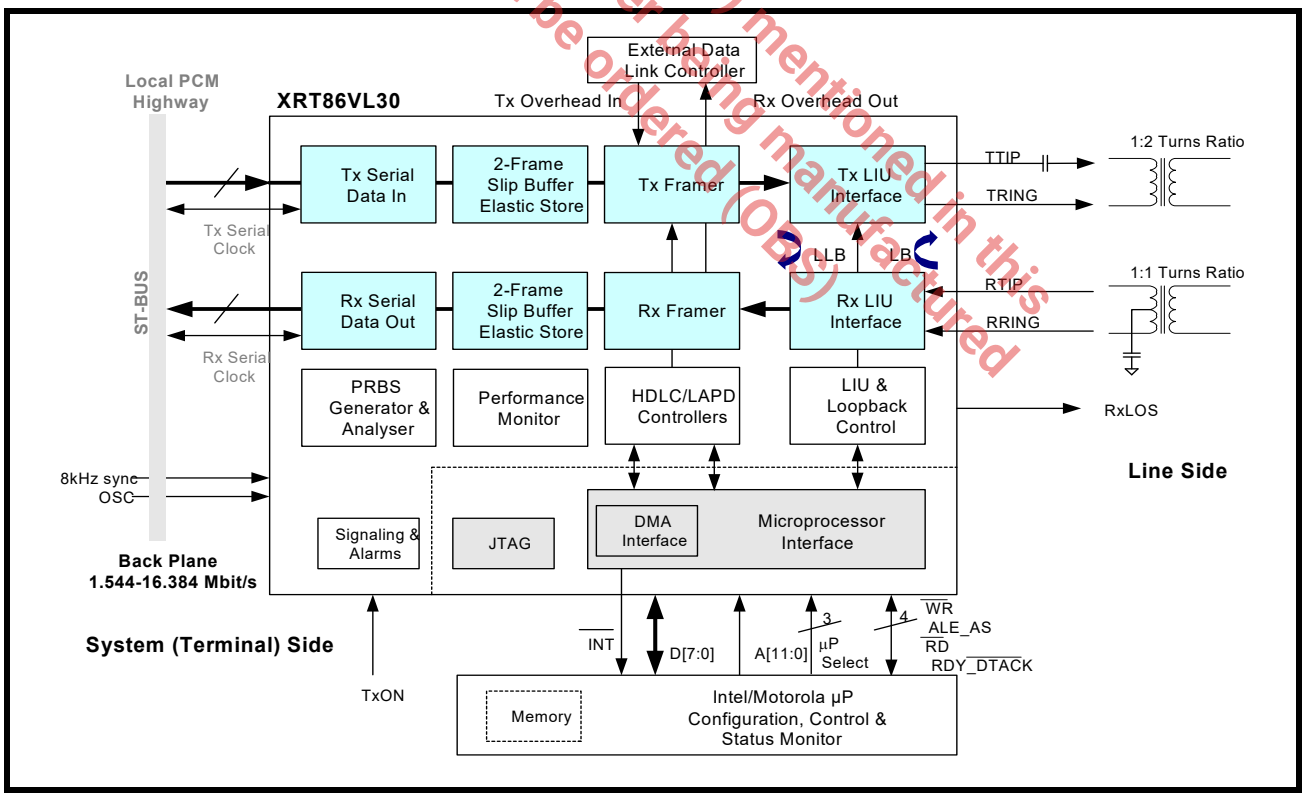

The Framer block contains its own Transmit and Receive T1/E1/J1 Framing function. There are 3 Transmit HDLC controllers which encapsulate contents of the Transmit HDLC buffers into LAPD Message frames. There are 3 Receive HDLC controllers which extract the payload content of Receive LAPD Message frames from the incoming T1/E1/J1 data stream and write the contents into the Receive HDLC buffers. The framer also contains a Transmit and Overhead Data Input port, which permits Data Link Terminal Equipment direct access to the outbound T1/E1/J1 frames. Likewise, a Receive Overhead output data port permits Data Link Terminal Equipment direct access to the Data Link bits of the inbound T1/E1/J1 frames.

The XRT86VL30 fully meets all of the latest T1/E1/J1 specifications: ANSI T1/E1.107-1988, ANSI T1/ E1.403-1995, ANSI T1/E1.231-1993, ANSI T1/ E1.408-1990, AT&T TR 62411 (12-90) TR54016, and ITU G-703, G.704, G706 and G.733, AT&T Pub. 43801, and ETS 300 011, 300 233, JT G.703, JT G.704, JT G706, I.431. Extensive test and diagnostic functions include Loop-backs, Boundary scan, Pseudo Random bit sequence (PRBS) test pattern generation, Performance Monitor, Bit Error Rate (BER) meter, forced error insertion, and LAPD unchannelized data payload processing according to ITU-T standard Q.921.

***APPLICATIONS AND FEATURES (NEXT PAGE)***

The product (or product(s) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**FIGURE 1. XRT86VL30 SINGLE CHANNEL DS1 (T1/E1/J1) FRAMER/LIU COMBO**

### *APPLICATIONS*

- High-Density T1/E1/J1 interfaces for Multiplexers, Switches, LAN Routers and Digital Modems
- SONET/SDH terminal or Add/Drop multiplexers (ADMs)
- T1/E1/J1 add/drop multiplexers (MUX)
- Channel Service Units (CSUs): T1/E1/J1 and Fractional T1/E1/J1
- Digital Access Cross-connect System (DACs)
- Digital Cross-connect Systems (DCS)
- Frame Relay Switches and Access Devices (FRADS)
- ISDN Primary Rate Interfaces (PRA)
- PBXs and PCM channel bank
- T3 channelized access concentrators and M13 MUX
- Wireless base stations
- ATM equipment with integrated DS1 interfaces
- Multichannel DS1 Test Equipment
- T1/E1/J1 Performance Monitoring
- Voice over packet gateways
- Routers

### *FEATURES*

- Supports SSM Synchronization Messaging per ANSI T1.101-1999 and ITU G.704
- Supports a Customized Section 13 - Synchronization Interface in G.703 at 1.544MHz
- Independent, full duplex DS1 Tx and Rx Framer/LIUs
- Two 512-bit (two-frame) elastic store, PCM frame slip buffers (FIFO) on TX and Rx provide up to 8.192 MHz asynchronous back plane connections with jitter and wander attenuation
- Supports input PCM and signaling data at 1.544, 2.048, 4.096 and 8.192 Mbits. Also supports 2-channel multiplexed 12.352/16.384 (HMVIP/H.100) Mbit/s on the back plane bus
- Programmable output clocks for Fractional T1/E1/J1
- Supports Channel Associated Signaling (CAS)
- Supports Common Channel Signalling (CCS)
- Supports ISDN Primary Rate Interface (ISDN PRI) signaling
- Extracts and inserts robbed bit signaling (RBS)
- 3 Integrated HDLC controllers for transmit and receive, each controller having two 96-byte buffers (buffer 0 / buffer 1)
- HDLC Controllers Support SS7
- Timeslot assignable HDLC
- V5.1 or V5.2 Interface
- Automatic Performance Report Generation (PMON Status) can be inserted into the transmit LAPD interface every 1 second or for a single transmission
- Alarm Indication Signal with Customer Installation signature (AIS-CI)

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

- Remote Alarm Indication with Customer Installation (RAI-CI)
- Gapped Clock interface mode for Transmit and Receive.
- Intel/Motorola and Power PC interfaces for configuration, control and status monitoring
- Parallel search algorithm for fast frame synchronization
- Wide choice of T1 framing structures: SF/D4, ESF, SLC®96, T1DM and N-Frame (non-signaling)
- Direct access to D and E channels for fast transmission of data link information
- PRBS, QRSS, and Network Loop Code generation and detection
- Programmable Interrupt output pin
- Supports programmed I/O and DMA modes of Read-Write access
- The framer block encodes and decodes the T1/E1/J1 Frame serial data
- Detects and forces Red (SAI), Yellow (RAI) and Blue (AIS) Alarms
- Detects OOF, LOF, LOS errors and COFA conditions
- Loopbacks: Local (LLB) and Line remote (LB)
- Facilitates Inverse Multiplexing for ATM
- Performance monitor with one second polling
- Boundary scan (IEEE 1149.1) JTAG test port
- Accepts external 8kHz Sync reference
- 1.8V Inner Core
- 3.3V CMOS operation with 5V tolerant inputs
- 128-pin LQFP and 80-pin LQFP package with -40°C to +85°C operation

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

## ORDERING INFORMATION

| PART NUMBER | PACKAGE | OPERATING TEMPERATURE RANGE |
|---|---|---|
| XRT86VL30IV-F | 128 Pin LQFP(14x20x1.4mm) | -40°C to +85°C |
| XRT86VL30IV80-F | 80 Pin LQFP (12x12x1.4mm) | -40°C to +85°C |

## 1.0 REGISTER DESCRIPTIONS - T1 MODE

All address on this register description is shown in HEX format

**TABLE 2: CLOCK SELECT REGISTER(CSR)** **HEX ADDRESS: 0X0100**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7 | LCV Insert | R/W | 0 | **Line Code Violation Insertion**<br>This bit is used to force a Line Code Violation (LCV) on the transmit output of TTIP/TRING.<br>A "0" to "1" transition on this bit will cause a single LCV to be inserted on the transmit output of TTIP/TRING. |
| 6 | Set T1 Mode | R/W | 0 | **T1 Mode select**<br>This bit is used to program the individual channel to operate in either T1 or E1 mode.<br>0 = Configures the selected channel to operate in E1 mode.<br>1 = Configures the selected channel to operate in T1 mode. |
| 5 | Sync All Transmit-ters to 8kHz | R/W | 0 | **Sync All Transmit Framers to 8kHz**<br>This bit permits the user to configure the Transmit T1 Framer block to synchronize its "transmit output" frame alignment with the 8kHz signal that is derived from the MCLK PLL, as described below.<br>0 - Disables the "Sync all Transmit Framers to 8kHz" feature.<br>1 - Enables the "Sync all Transmit Framers to 8kHz" feature.<br>***NOTE:*** *This bit is only active if the MCLK PLL is used as the "Timing Source" for the Transmit T1 Framer" blocks. CSS[1:0] of this register allows users to select the transmit source of the framer.* |
| 4 | Clock Loss Detect | R/W | 1 | **Clock Loss Detect Enable/Disable Select**<br>This bit enables a clock loss protection feature for the Framer whenever the recovered line clock is used as the timing source for the transmit section. If the LIU loses clock recovery, the Clock Distribution Block will detect this occurrence and automatically begin to use the internal clock derived from MCLK PLL as the Transmit source, until the LIU is able to regain clock recovery.<br>0 = Disables the clock loss protection feature.<br>1 = Enables the clock loss protection feature.<br>***NOTE:*** *This bit needs to be enabled in order to detect the clock closs detection interrupt status (address: 0x0B00, bit 5)* |
| 3:2 | Reserved | R/W | 00 | **Reserved** |

The product(or products) mentioned in this data sheet are no longer being manufactured and may not be available (OBS)

**TABLE 2: CLOCK SELECT REGISTER(CSR)** **HEX ADDRESS: 0X0100**

<table>
<tr><th>BIT</th><th>FUNCTION</th><th>TYPE</th><th>DEFAULT</th><th>DESCRIPTION-OPERATION</th></tr>
<tr><td>1:0</td><td>CSS[1:0]</td><td>R/W</td><td>01</td><td>Clock Source Select<br>These bits select the timing source for the Transmit T1 Framer block. These bits can also determine the direction of TxSERCLK, TxSYNC, and TxMSYNC in base rate operation mode (1.544MHz Clock mode).<br>In Base Rate (1.544MHz Clock Mode):
<table>
<tr><th>CSS[1:0]</th><th>TRANSMIT SOURCE FOR THE TRANSMIT T1 FRAMER BLOCK</th><th>DIRECTION OF TXSERCLK</th></tr>
<tr><td>00/11</td><td>Loop Timing Mode<br>The recovered line clock is chosen as the timing source.</td><td>Output</td></tr>
<tr><td>01</td><td>External Timing Mode<br>The Transmit Serial Input Clock from the TxSERCLK_n input pin is chosen as the timing source.</td><td>Input</td></tr>
<tr><td>10</td><td>Internal Timing Mode<br>The MCLK PLL is chosen as the timing source.</td><td>Output</td></tr>
</table>
NOTE: TxSYNC/TxMSYNC can be programmed as input or output depending on the setting of SYNC INV bit in Register Address 0x0109, bit 4. Please see Register Description for the Synchronization Mux Register (SMR - 0x0109) Table 9.<br>NOTES: In High-Speed or multiplexed modes, TxSERCLK, TxSYNC, and TxMSYNC are all configured as INPUTS only.</td></tr>
</table>

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 3: LINE INTERFACE CONTROL REGISTER (LICR)** **HEX ADDRESS: 0X0101**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7 | FORCE_LOS | R/W | 0 | **Force Transmit LOS (To the Line Side)**<br>This bit permits the user to configure the transmit direction circuitry (within the channel) to transmit the LOS pattern to the remote terminal equipment, as described below.<br>0 - Configures the transmit direction circuitry to transmit “normal” traffic.<br>1 - Configures the transmit direction circuitry to transmit the LOS Pattern. |
| 6 | Reserved | R/W | 0 | **Single Rail Mode**<br>This bit can only be set if the LIU Block is also set to single rail mode. See Register 0x0FE0, bit 7.<br>0 - Dual Rail<br>1 - Single Rail |
| 5:4 | LB[1:0] | R/W | 00 | **Framer Loopback Selection**<br>These bits are used to select any of the following loop-back modes for the framer section. For LIU loopback modes, see the LIU configuration registers. |
| 3:2 | Reserved | R/W | 0 | **Reserved** |

| LB[1:0] | TYPES OF LOOPBACK SELECTED |
|---|---|
| 00 | Normal Mode (No LoopBack) |
| 01 | **Framer Local LoopBack:**<br>When framer local loopback is enabled, the transmit PCM input data is looped back to the receive PCM output data. The receive input data at RTIP/RRING is ignored while an All Ones Signal is transmitted out to the line interface. |
| 10 | **Framer Far-End (Remote) Line LoopBack:**<br>When framer remote loopback is enabled, the digital data enters the framer interface, however does not enter the framing blocks. The receive digital data from the LIU is allowed to pass through the LIU Decoder/ Encoder circuitry before returning to the line interface. |
| 11 | **Framer Payload LoopBack:**<br>When framer payload loopback is enabled, the raw data within the receive time slots are looped back to the transmit framer block where the data is re-framed according to the transmit timing. |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (obsolete)

**TABLE 3: LINE INTERFACE CONTROL REGISTER (LICR)** **HEX ADDRESS: 0X0101**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 1 | Encode B8ZS | R/W | 0 | **Encode AMI or B8ZS/HDB3 Line Code Select**<br>This bit enables or disables the B8ZS/HDB3 encoder on the transmit path.<br>0 = Enables the B8ZS encoder.<br>1 = Disables the B8ZS encoder.<br>***NOTE:*** *When B8ZS encoder is disabled, AMI line code is used.* |
| 0 | Decode AMI/B8ZS | R/W | 0 | **Decode AMI or B8ZS/HDB3 Line Code Select**<br>This bit enables or disables the B8ZS/HDB3 decoder on the receive path.<br>0 = Enables the B8ZS decoder.<br>1 = Disables the B8ZS decoder.<br>***NOTE:*** *When B8ZS decoder is disabled, AMI line code is received.* |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 4: GENERAL PURPOSE INPUT/OUTPUT CONTROL REGISTER (GPIOCR)** **HEX ADDRESS: 0X0102**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7-4 | GPIO0_3DIR<br>GPIO0_2DIR<br>GPIO0_1DIR<br>GPIO0_0DIR | R/W | 1111 | **GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 Direction**<br>These bits permit the user to define the General Purpose I/O Pins, GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 as either Input pins or Output pins, as described below.<br>0 – Configures GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 to function as input pins.<br>1 – Configures GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 to function as output pins.<br>**1.** If GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 are configured to function as input pins, then the user can monitor the state of these input pins by reading out the state of Bit 3-0 (GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0) within this register.<br>**2.** If GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 are configured to function as output pins, then the user can control the state of these output pins by writing the appropriate value into Bit 3-0 (GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0) within this register. |
| 3-0 | GPIO0_3<br>GPIO0_2<br>GPIO0_1<br>GPIO0_0 | R/W | 0000 | **GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 Control**<br>The exact function of this bit depends upon whether General Purpose I/O Pins, GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 have been configured to function as input or output pins, as described below.<br>**If GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 are configured to function as input pins:**<br>If GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 are configured to function as input pins, then the user can monitor the state of the corresponding input pin by reading out the state of these bits.<br>***NOTE:*** *If GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 are configured to function as input pins, then writing to this particular register will have no effect on the state of this pin.*<br>**If GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 are configured to function as output pins:**<br>If GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 are configured to function as output pins, then the user can control the state of the corresponding output pin by writing the appropriate value to these bits.<br>***NOTE:*** GPIO0_3/GPIO0_2/GPIO0_1/GPIO0_0 *can be configured to function as input or output pins, by writing the appropriate value to Bit 7-4 (GPIO0_3DIR/GPIO0_2DIR/GPIO0_1DIR/GPIO0_0DIR) within this register.* |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 5: FRAMING SELECT REGISTER (FSR)** **HEX ADDRESS: 0X0107**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7 | Signaling update on Superframe Boundaries | R/W | 0 | **Enable Robbed-Bit Signaling Update on Superframe Boundary on Both Transmit and Receive Direction**<br>This bit enables or disables robbed-bit signaling update on the superframe boundary for both the transmit and receive side of the framer.<br>**On the Receive Side:**<br>If signaling update is enabled, signaling data on the receive side (RxSIG pin and Signaling Array Register - RSAR) will be updated on the superframe boundary, otherwise, signaling data will be updated as soon as it is received.<br>**On the Transmit Side:**<br>If signaling update is enabled, any signaling data changes on the transmit side will be transmitted on the superframe boundary, otherwise, signaling data will be transmitted as soon as it is changed.<br>0 - Disables the signaling update feature for both transmit and receive.<br>1 - Enables the signaling update feature for both transmit and receive. |
| 6 | Force CRC Errors | R/W | 0 | **Force CRC Errors (To the Line Side)**<br>This bit permits the user to force the Transmit T1 Framer block to transmit CRC errors within the outbound T1 data-stream, as depicted below.<br>0 - Disables CRC error transmission on the outbound T1 stream.<br>1 - Enables CRC error transmission on the outbound T1 stream. |
| 5 | J1_MODE | R/W | 0 | **J1 Mode**<br>This bit is used to configure the device in J1 mode. Once the device is configured in J1 mode, the following two changes will happen:<br>**1.** CRC calculation is done in J1 format. The J1 CRC6 calculation is based on the actual values of all 4632 bits in a T1 multiframe including Fe bits instead of assuming all Fe bits to be a one in T1 format.<br>**2.** Receive and Transmit Yellow Alarm signal format is interpreted per the J1 standard. (J1-SF or J1-ESF)<br>0 - Configures the device in T1 mode. (Default)<br>1 - Configures the device in J1 mode.<br>***NOTE:*** *Users can select between J1-SF or J1-ESF by setting this bit and the T1 Framing Mode Select Bits[2:0] (Bits 2-0 within this register).* |
| 4 | ONEONLY | R/W | 0 | **Allow Only One Sync Candidate**<br>This bit is used to specify one of the synchronization criteria that the Receive T1 Framer block employs.<br>0 - Allows the Receive T1 Framer to select any one of the winners in the matching process when there are two or more valid synchronization patterns appear in the required time frame.<br>1 - Allows the Receive T1 Framer to declare success of match when there is only one candidate left in the required time frame. |

The product (or product(s) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 5: FRAMING SELECT REGISTER (FSR)** **HEX ADDRESS: 0X0107**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 3 | FASTSYNC | R/W | 0 | **Faster Sync Algorithm**<br>This bit is used to specify one of the synchronization criteria that the Receive T1 Framer block employs. If this "Faster Sync Algorithm" is enabled, the Receive T1 Framer Block will declare synchronization earlier. The table below specifies the number of consecutive frames with correct F-bits that the T1 Receive framer must receive in order to declare "SYNC" when FASTSYNC is enabled or disabled.<br><br>Framing / FastSync = 0 / FastSync = 1<br>ESF / 96 / 48<br>SF / 48 / 24<br>N / 48 / 24<br>SLC ® 96 / 48 / 24<br><br>0 - Disables FASTSYNC feature.<br>1 - Enables FASTSYNC feature. |
| 2-0 | FSI[2:0] | R/W | 000 | **T1 Framing Mode Select [2:0]**<br>These three bits permit the user to select the exact T1 framing format that the channel is to operate in.<br>Bit 2 is MSB and Bit 0 is LSB. The following table shows the five different framing formats that can be selected by configuring these three bits accordingly.<br>***NOTE:*** *Changing Framing formats 'on the fly' will cause the Receive T1 Framer block to undergo a "Reframe" event.*<br><br>Framing / FS[2] / FS[1] / FS[0]<br>ESF / 0 / X / X<br>SF / 1 / 0 / 1<br>N / 1 / 1 / 0<br>T1DM / 1 / 1 / 1<br>SLC®96 / 1 / 0 / 0 |

The product (or product) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 6: ALARM GENERATION REGISTER (AGR)** **HEX ADDRESS: 0X0108**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7 | Yellow Alarm - One Second Rule | R/W | 0 | **One-Second Yellow Alarm Rule Enforcement**<br>This bit is used to enforce the one-second yellow alarm rule according to the yellow alarm (RAI) transmission duration per the ANSI standards.<br>**If the one second alarm rule is enforced, the following will happen:**<br>**1.** RAI will be transmitted for at least one second for both ESF and SF.<br>**2.** There must be a minimum of one second delay between termination of the first RAI and the initiation of a subsequent RAI.<br>**3.** ALARM_ENB bit (see description of bit 6 of this register) controls the duration of RAI.<br>**4.** YEL[0] & YEL[1] (see description of bits 5-4 of this register) controls the format of RAI.<br>**If the one second alarm rule is NOT enforced, the following will happen:**<br>**1.** RAI will be transmitted for at least one second for ESF and SF.<br>**2.** Minimum one second delay between termination of the first RAI and the initiation of the subsequent RAI is NOT enforced.<br>**3.** YEL[0] and YEL[1] bits (see description of bits 5-4 of this register) are used to control the duration AND the format of RAI transmission.<br>0 - The one-second yellow alarm rule is NOT enforced.<br>1 - The one-second yellow alarm rule is enforced.<br>***NOTE:*** *When setting this bit to '0', yellow alarm transmission will be backward compatible with the XRT86L38 device. XRT86L38 does not support the one-second yellow alarm rule.* |
| 6 | ALARM_ENB | R/W | 0 | **Yellow Alarm Transmission Enable**<br>This bit is used to control the duration of yellow alarm (RAI) when the one-second yellow alarm rule is enforced (bit 7 of this register set to'1').<br>When the one-second yellow alarm rule is not enforced (bit 7 of this register set to'0'), the duration of the RAI is controlled by the YEL[0] and YEL[1] bits (bits 5-4 of this register).<br>**If the one-second alarm rule is enforced:**<br>0 - Stop the transmission of yellow alarm (see description of bits 5-4).<br>1 - Start the transmission of yellow alarm (see description of bits 5-4).<br>***NOTE:*** *This bit has no function if the one second alarm rule is not enforced.* |

The product(s) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 6: ALARM GENERATION REGISTER (AGR)** **HEX ADDRESS: 0X0108**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 5-4 | YEL[1:0] | R/W | 00 | **Yellow Alarm (RAI) Duration and Format**<br>The exact function of these bits depends on whether or not the one-second yellow alarm rule is enforced. (Bit 7 of this register). The decoding of these bits are explained in Table 7 and Table 8 below. |

**TABLE 7: YELLOW ALARM DURATION AND FORMAT WHEN ONE SECOND RULE IS NOT ENFORCED**

| YEL[1:0] | YELLOW ALARM DURATION AND FORMAT |
|---|---|
| 00 | Disable the transmission of yellow alarm |
| 01 | **SF or N mode:**<br>RAI is transmitted as bit 2 = 0 (second MSB) in all DS0 data channel.<br>**T1DM mode:**<br>RAI is transmitted as Y-bit = 0 (6th bit in the SYNC byte).<br>**ESF mode:**<br>1. If YEL[0] bit is set 'high' for a duration shorter or equal to the time required to transmit 255 patterns of 1111_1111_0000_0000 on the 4-kbit/s data link bits (M1-M12), RAI is transmitted for 255 patterns.of 1111_1111_0000_0000 (approximately 1 second)<br>2. If YEL[0] bit is set 'high' for a duration longer than the time required to transmit 255 patterns of 1111_1111_0000_0000 on the 4-kbit/s data link bits (M1-M12), RAI transmission continues until YEL[0] bit is set 'low'.<br>3. If YEL[0] bit forms another pulse during the RAI transmission, it resets the pattern counter and extends the RAI duration for another 255 patterns of 1111_1111_0000_0000. (approximately 1 second) |
| 10 | **SF mode:**<br>RAI is transmitted as a "1" in the Fs bit of frame 12 (This is RAI for J1 SF standard).<br>**T1DM mode**:<br>RAI is transmitted as Y-bit = 0 (6th bit in the SYNC byte).<br>**ESF mode**:<br>RAI is controlled by the duration of YEL[1] bit. This allows continuous RAI of any length. |
| 11 | **SF, N, and T1DM mode:**<br>RAI format is the same as described above when YEL[1:0] is set to'01'.<br>**ESF mode:**<br>RAI duration is the same as described above when YEL[1:0] is set to'01', except that format of RAI is transmitted as 255 patterns of 1111_1111_1111_1111 (sixteen ones) on the 4kbits/s data link bits instead of 255 patterns of 1111_1111_0000_0000.<br>***NOTE:*** *255 patterns of 1111_1111_1111_111 is the J1 ESF RAI standard)* |

**TABLE 18: TRANSMIT DATA LINK BYTE COUNT REGISTER (TDLBCR1)** **HEX ADDRESS: 0X0114**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7 | TxHDLC1 BUFAvail/ BUFSel | R/W | 0 | **Transmit HDLC1 Buffer Available/Buffer Select**<br>This bit has different functions, depending upon whether the user is writing to or reading from this register, as depicted below.<br>**If the user is writing data into this register bit:**<br>0 - Configures the Transmit HDLC1 Controller to read out and transmit the data, residing within "Transmit HDLC1 Buffer # 0", via the Data Link channel to the remote terminal equipment.<br>1 - Configures the Transmit HDLC1 Controller to read out and transmit the data, residing within the "Transmit HDLC1 Buffer #1", via the Data Link channel to the remote terminal equipment.<br>**If the user is reading data from this register bit:**<br>0 - Indicates that "Transmit HDLC1 Buffer # 0" is the next available buffer. In this case, if the user wishes to write in the contents of a new "outbound" Data Link Message into the Transmit HDLC1 Message Buffer, he/she should proceed to write this message into "Transmit HDLC1 Buffer # 0" - Address location: 0x0600.<br>1 - Indicates that "Transmit HDLC1 Buffer # 1" is the next available buffer. In this case, if the user wishes to write in the contents of a new "outbound" Data Link Message into the Transmit HDLC1 Message Buffer, he/she should proceed to write this message into "Transmit HDLC1 Buffer # 1" - Address location: 0x0700.<br>***NOTE:*** *If one of these Transmit HDLC1 buffers contain a message which has yet to be completely read-in and processed for transmission by the Transmit HDLC1 controller, then this bit will automatically reflect the value corresponding to the next available buffer when it is read. Changing this bit to the in-use buffer is not permitted.* |
| 6-0 | TDLBC[6:0] | R/W | 0000000 | **Transmit HDLC1 Message - Byte Count**<br>The exact function of these bits depends on whether the Transmit HDLC 1 Controller is configured to transmit MOS or BOS messages to the Remote Terminal Equipment.<br>**In BOS MODE:**<br>These bit fields contain the number of repetitions the BOS message must be transmitted before the Transmit HDLC1 controller generates the Transmit End of Transfer (TxEOT) interrupt and halts transmission. If these fields are set to 00000000, then the BOS message will be transmitted for an indefinite number of times.<br>**In MOS MODE:**<br>These bit fields contain the length, in number of octets, of the message to be transmitted. The length of MOS message specified in these bits include header bytes such as the SAPI, TEI, Control field, however, it does not include the FCS bytes. |

The product (or product mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS).

**TABLE 19: RECEIVE DATA LINK BYTE COUNT REGISTER (RDLBCR1)** **HEX ADDRESS: 0X0115**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7 | RBUFPTR | R/W | 0 | **Receive HDLC1 Buffer-Pointer**<br>This bit Identifies which Receive HDLC1 buffer contains the most recently received HDLC1 message.<br>0 - Indicates that Receive HDLC1 Buffer # 0 contains the contents of the most recently received HDLC message.<br>1 - Indicates that Receive HDLC1 Buffer # 1 contains the contents of the most recently received HDLC message. |
| 6-0 | RDLBC[6:0] | R/W | 0000000 | **Receive HDLC Message - byte count**<br>The exact function of these bits depends on whether the Receive HDLC Controller Block #1 is configured to receive MOS or BOS messages.<br>**In BOS Mode:**<br>These seven bits contain the number of repetitions the BOS message must be received before the Receive HDLC1 controller generates the Receive End of Transfer (RxEOT) interrupt. If these bits are set to “0000000”, the message will be received indefinitely and no Receive End of Transfer (RxEOT) interrupt will be generated.<br>**In MOS Mode:**<br>These seven bits contain the size in bytes of the HDLC1 message that has been received and written into the Receive HDLC buffer. The length of MOS message shown in these bits include header bytes such as the SAPI, TEI, Control field, AND the FCS bytes. |

### 1.1 T1 Synchronization status message

T1 synchronization messages are sent through the FDL (Facility Data Link) bits by using a BOC (Bit Oriented Code) controller within the XRT86VL30 device. The most right bit position in the BOC code is sent first. The SSM message that are used in typical BITS applications are shown below. These messages are defined in specification ANSI T1.101-1999.

**TABLE 56: T1 SSM MESSAGES**

| QUALITY LEVEL | DESCRIPTION | BOC CODE |
|---|---|---|
| 1 | Stratum 1 Traceable | 00000100 11111111 |
| 2 | Synchronized Traceability Unknown | 00001000 11111111 |
| 3 | Stratum 2 Traceable | 00001100 11111111 |
| 4 | Stratum 3 Traceable | 00010000 11111111 |
| 5 | SONET Minimum Clock Traceable | 00100010 11111111 |
| 6 | Stratum 4 Traceable | 00101000 11111111 |
| 7 | Do Not Use for Synchronization | 00110000 11111111 |
| User Assignable | Reserved for Network Synchronization Use | 01000000 11111111 |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

### 1.2 T1 BOC Receiver

If enabled, the T1 BOC receiver will monitor the FDL bits for SSM messages with various features being supported. Some of these features are Change of Status Alarm, 3 independent pre-set codes for matching validation (each having its own alarm), filter settings for consecutive pattern qualification, and many more.

**NOTE:** *If the receive BOC is enabled. the part will still report BOS and MOS messages as described in the register descriptions.*

### 1.3 T1 BOC Transmitter

The T1 BOC transmitter will automatically insert an SSM message in the correct FDL bit positions if enabled. Once the message is stored in the TFDL register, Bit 0=1 sends the message, automatically followed by the Abort Sequence.

**TABLE 57: SSM BOC CONTROL REGISTER (BOCCR 0X0170H)**

| BIT7 | BIT6 | BIT5 | BIT4 | BIT3 | BIT2 | BIT1 | BIT0 |
|---|---|---|---|---|---|---|---|
| TxABORT | RMF[1:0] | | RBOCE | BOCR | RBF[1:0] | | SBOC |
| R/W | R/W | R/W | R/W | Auto Clear | R/W | R/W | Auto Clear |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**BIT 7 - Transmit Abort Sequence Enable**

By default, the transmitter will send an IDLE flag after the SSM message (unless continous is set). To send an Abort sequence to over write the IDLE flag, set this bit to '1'.

} 0 - Disabled

} 1 - Enable TxABORT

**BITS [6:5] - Receive Match Filter Bits**

These bits are used to set the number of consecutive error free patterns that must be received before the receive Match Event is set. This filter can be set to any message, not just a Valid SSM message. This filter does NOT apply to the RFDL valid message or alarm indication. The RFDL alarm and valid register have their own filter. See BITS [2:1] of this register.

} 00 - None

} 01 - 3 consecutive patterns

} 10 - 5 consecutive patterns

} 11 - 7 consecutive patterns

**BIT 4 - Receive BOC Enable**

This bit is used to enable the BOC receiver. If this bit is set to "0", only standard BOS messages will be processed by the HDLC controller. For clarification, BOC messages can only be processed through the FDL bits.

} 0 - Disabled

} 1 - Enable Receive BOC

**BIT 3 - BOC Reset**

This bit is used to reset the receive BOC controller. The function of this bit is to reset all the BOC register values to their default values, except the BOC Interrupt registers. This register bit is automatically set back to '0' so that the user only needs to write '1' to send a subsequent reset.

} 1 - Reset BOC

**BITS [2:1] - Receive BOC Filter Bits**

These bits are used to set the number of consecutive error free patterns that must be received before the receive BOC alarm indication is set and the RFDL Valid Register is updated. This filter does NOT apply to the RFDL Matching Event registers. The 3 RFDL Matching Event Registers have a separate filter that applies equally to all three matching registers. Therefore, there are a total of 2 filters.

} 00 - None

} 01 - 3 consecutive patterns

} 10 - 5 consecutive patterns

} 11 - 7 consecutive patterns

**BIT 0 - Send BOC Message**

This bit is used to transmit the stored BOC message in the transmit FDL register. This register bit is automatically set back to '0' so that the user only needs to write '1' to send a subsequent BOC message.

} 0 - Normal Operation

} 1 - Send BOC Message

| 0xB | The MSB (bit 1) of input data is inverted |
| 0xC | All input data except MSB is inverted |
| 0xD | Contents of the timeslot octet will be substituted with the PRBS $X^{15}$ + $X^{14}$ + 1/QRTS pattern<br>***NOTE:*** *PRBS $X^{15}$ + $X^{14}$ + 1 or QRTS pattern depends on PRBSType selected in the register 0x0123 - bit 7* |
| 0xF | D/E time slot - The RxDE[2:0] bits in the Transmit Signaling and Data Link Select Register (0x010C) will determine the data source for Receive D/E time slots. |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 70: RECEIVE USER CODE REGISTER 0-23 (RUCR 0-23)** **HEX ADDRESS: 0X0380 TO 0X0397**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7-0 | RxUSER[7:0] | R/W | 11111111 | **Receive Programmable User code.**<br>These eight bits allow users to program any code in this register to replace the received data when the Receive Channel Control Register (RCCR) is configured to replace timeslot octet with the receive programmable user code. (i.e. if RCCR is set to '0x4') |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 71: RECEIVE SIGNALING CONTROL REGISTER 0-23 (RSCR 0-23) HEX ADDRESS: 0X03A0 TO 0X03B7**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 6 | SIGC_ENB | R/W | 0 | **Signaling substitution enable**<br>This bit enables or disables signaling substitution on the receive side. Once signaling substitution is enabled, received signaling bits ABCD will be substituted with the ABCD values in the Receive Substitution Signaling Register (RSSR).<br>Signaling substitution only occurs in the output PCM data (RxSERn). Receive Signaling Array Register (RSAR - Address 0x0500-0x051F) and the external Signaling bus (RxSIG_n) output pin will not be affected.<br>0 = Disables signaling substitution on the receive side.<br>1 = Enables signaling substitution on the receive side. |
| 5 | OH_ENB | R/W | 0 | **Signaling OH interface output enable**<br>This bit enables or disables signaling information to output via the Receive Overhead pin (RxOH_n). The signaling information in the receive signaling array registers (RSAR - Address 0x0500-0x051F) is output to the receive overhead output pin (RxOH_n) if this bit is enabled.<br>0 = Disables signaling information to output via RxOH_n.<br>1 = Enables signaling information to output via RxOH_n. |
| 4 | DEB_ENB | R/W | 0 | **Per-channel debounce enable**<br>This bit enables or disables the signaling debounce feature.<br>When this feature is enabled, the per-channel signaling state must be in the same state for 2 superframes before the Receive Framer updates signaling information on the Receive Signaling Array Register (RSAR) and the Signaling Pin (RxSIGn). If the signaling bits for two consecutive superframes are not the same, the current state of RSAR and RxSIG will not change.<br>When this feature is disabled, RSAR and RxSIG will be updated as soon as the receive signaling bits have changed.<br>0 = Disables the Signaling Debounce feature.<br>1 = Enables the Signaling Debounce feature. |

The product (or products) mentioned in this data sheet are no longer in manufactured and may not be offered (OBS)

} 0 - No Match

} 1 - Match 3

**BIT 6 - Receive FDL Match 2 Event**

This bit is set when the receive FDL message is equal to the RFDL Match 2 message, and filter validation has occured.

} 0 - No Match

} 1 - Match 2

**BIT 5 - BOC Clear Event (Loss of BOC)**

This bit is set when 3 or more consecutive Non-BOC messages occur (Non-BOC means that the message meets the '0xxxxxx011111111' framing format, but does not contain a valid BOC).

} 0 - No Change

} 1 - BOC Cleared

**BIT 4 - RFDL Abort Detect Event**

This bit is set when nine consecutive ones are detected within the FDL bits.

} 0 - Normal

} 1 - RFDL Abort

**BIT 3 - RFDL Register Full Event (Receive Start of Transfer)**

This bit is set when the RFDL register is full. This register is not gated by the filter.

} 0 - Not Full

} 1 - Full

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**BIT 2 - TFDL Register Empty Event (Transmit End of Transfer)**

This bit is set when the TFDL register has been emptied according to amount of repetitions programmed into the TxBYTE count register 0xn178h. This alarm is meant to be an indicator of a complete BOC transmission for system alert or to initiate a response for future processing.

} 0 - Not Emptied

} 1 - Emptied

**BIT 1 - Receive FDL Match 1 Event**

This bit is set when the receive FDL message is equal to the RFDL Match 1 message, and filter validation has occured.

} 0 - No Match

} 1 - Match 1

**BIT 0 - Receive BOC Detector Change of Status**

This bit is set to 1 any time a change has occured with the RFDL message. This alarm will NOT be set unless the filter setting has been satisfied.

} 0 - No Change

} 1 - Change of Status

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

**TABLE 129: LIU CHANNEL CONTROL REGISTER 2 (LIUCCR2)** **HEX ADDRESS: 0X0F02**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 7 | INVQRSS_n | R/W | 0 | **Invert QRSS Pattern:**<br>This bit inverts the output PRBS/QRSS pattern if the LIU Block is configured to transmit a PRBS/QRSS pattern.<br>0 = The LIU will NOT invert the output PRBS/QRSS pattern<br>1 = The LIU will invert the output PRBS/QRSS pattern |
| 6-4 | TXTEST[2:0] | R/W | 000 | **Transmit Test Pattern [2:0]**:<br>These bits are used to configure the Transmit T1 LIU Block to generate and transmit test patterns according to the following table. Use of these bits automatically places the LIU section in Single Rail mode. When this happens, the Framer section must be placed in Single Rail mode in Reg 0x0101. |

| TXTEST2 | TXTEST1 | TXTEST0 | Test Pattern |
|---|---|---|---|
| 0 | X | X | No Pattern |
| 1 | 0 | 0 | TDQRSS |
| 1 | 0 | 1 | TAOS |
| 1 | 1 | 0 | TLUC |
| 1 | 1 | 1 | TLDC |

**TDQRSS (Transmit/Detect Quasi-Random Signal):**

QRSS pattern is a $2^{20}$-1 pseudo-random bit sequence (PRBS) with no more than 14 consecutive zeros.

**TAOS (Transmit All Ones):**

Whenever the user implements this configuration setting, the Transmit T1 LIU Block will ignore the data that it is accepting from the Transmit T1 Framer block (as well as the upstream system-side terminal equipment) and overwrite this data with the All Ones Pattern.

**TLUC (Transmit Network Loop-Up Code):**

The Transmit T1 LIU Block will generate and transmit the Network Loop-Up Code of “00001” to the line for the selected channel number n.

When Network Loop-Up code is being transmitted, the XRT86VL30 will ignore the “Automatic Loop-Code detection and Remote Loop-Back activation” (NLCDE1 =“1”, NLCDE0 =“1” of register 0x0F03) in order to avoid activating Remote Digital Loop-Back automatically when the remote terminal responds to the Loop-Back request.

**TLDC (Transmit Network Loop-Down Code):**

The Transmit T1 LIU Block will generate and transmit the Network Loop-Down Code of “001” to the line for the selected channel number n.

The product (or products mentioned in this data sheet are no longer planned to be manufactured and may not be ordered (OBS)

**TABLE 132: LIU CHANNEL CONTROL STATUS REGISTER (LIUCCSR)** **HEX ADDRESS: 0X0F05**

| BIT | FUNCTION | TYPE | DEFAULT | DESCRIPTION-OPERATION |
|---|---|---|---|---|
| 3 | NLCD_n | RO | 0 | **Network Loop-Code Detection Status Bit:**<br>This bit operates differently in the Manual or the Automatic Network Loop-Code detection modes.<br>**Manual Loop-Up Code detection mode**<br>(.i.e If NLCDE1 = "0" and NLCDE0 = "1"), this bit gets set to "1" as soon as the Loop-Up Code ("00001") is detected in the receive data for longer than 5 seconds.<br>This bit stays high as long as the Receive T1 LIU Block detects the presence of the Loop-Up code in the receive data and it is reset to "0" as soon as it stops receiving the Loop-Up Code.<br>If the NLCD interrupt is enabled, the XRT86VL30 will initiate an interrupt on every transition of the NLCD status bit.<br>**Manual Loop-Down Code detection mode**<br>(i.e., If NLCDE1 = "1" and NLCDE0 = "0"), this bit gets set to "1" as soon as the Loop-Down Code ("001") is detected in the receive data for longer than 5 seconds.<br>This bit stays high as long as the Receive T1 LIU Block detects the presence of the Loop-Down code in the receive data and it is reset to "0" as soon as it stops receiving the Loop-Down Code.<br>If the NLCD interrupt is enabled, the XRT86VL30 will initiate an interrupt on every transition of the NLCD status bit.<br>**Automatic Loop-code detection mode**<br>(i.e., If NLCDE1 = "1" and NLCDE0 ="1"), the state of the NLCD status bit is reset to "0" and the XRT86VL30 is programmed to monitor the receive input data for the Loop-Up code.<br>This bit is set to a "1" to indicate that the Network Loop Code is detected for more than 5 seconds. Simultaneously, the Remote Loop-Back condition is automatically activated and the XRT86VL30 is programmed to monitor the receive data for the Network Loop Down code. The NLCD bit stays 'high' as long as the Remote Loop-Back condition is in effect even if the chip stops receiving the Loop-Up code. Remote Loop-Back is removed only if the XRT86VL30 detects the Loop-Down Code "001" pattern for longer than 5 seconds in the receive data. Upon detecting the Loop-Down Code "001" pattern, the XRT86VL30 will reset the NLCD status bit and an interrupt will be generated if the NLCD interrupt enable bit is enabled.<br>Users can monitor the state of this bit to determine if the Remote Loop-Back is activated. |
| 2 | Reserved | - | 0 | This Bit Is Not Used |
| 1 | RLOS_n | RO | 0 | **Receive Loss of Signal Defect Condition Status:**<br>This READ-ONLY bit indicates whether or not the Receive LIU Block is currently declaring the LOS defect condition.<br>0 = Indicates that the Receive Section is NOT currently declaring the LOS Defect Condition.<br>1 = Indicates that the Receive Section is currently declaring the LOS Defect condition.<br>***NOTE:*** *If the RLOSIE bit (bit D1 of Register 0x0F04) is enabled, any transition on this bit will generate an Interrupt.* |

## REVISION HISTORY

| REVISION # | DATE | DESCRIPTION |
|---|---|---|
| 1.0.0 | May 30, 2008 | Initial release of the XRT86VL30 datasheet. |
| 1.0.1 | Dec 18, 2009 | Clarified the RxSYNC (Sect 13) operation for the RLOS feature and added Register 0x0102 for the GPIO Control. |
| 1.0.2 | April 6, 2021 | Updated the part numbers in the Ordering Information tables. |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

### NOTICE

EXAR Corporation reserves the right to make changes to the products contained in this publication in order to improve design, performance or reliability. EXAR Corporation assumes no responsibility for the use of any circuits described herein, conveys no license under any patent or other right, and makes no representation that the circuits are free of patent infringement.
