A New Direction in Mixed-Signal

# XR8051, XR8052, XR8054

## Low Cost, High Speed Rail-to-Rail Amplifiers

## General Description

The XR8051 (single), XR8052 (dual) and XR8054 (quad) are low cost, voltage feedback amplifiers. These amplifiers are designed to operate on +3V to +5V, or ±5V supplies. The input voltage range extends 300mV below the negative rail and 0.9V below the positive rail.

The XR8051, XR8052, and XR8054 offer superior dynamic performance with a 260MHz small signal bandwidth and 190V/µs slew rate. The combination of low power, high output current drive, and rail-to-rail performance make these amplifiers well suited for battery-powered systems and video applications.

The combination of low cost and high performance make the XR8051, XR8052, and XR8054 suitable for high volume applications in both consumer and industrial applications such as video surveillance and distribution systems, professional and IPC cameras, active filter circuits, coaxial cable drivers, and electronic white boards.

### FEATURES

- 260MHz bandwidth
- Fully specified at +3V, +5V and ±5V supplies
- Output voltage range:
  - 0.03V to 4.95V; $V_S$ = +5; $R_L$ = 2kΩ
- Input voltage range:
  - -0.3V to +4.1V; $V_S$ = +5
- 190V/µs slew rate
- 2.6mA supply current per amplifier
- ±100mA linear output current
- ±125mA short circuit current
- XR8051 directly replaces AD8051, AD8091
- XR8052 directly replaces AD8052, AD8092
- XR8054 directly replaces AD8054

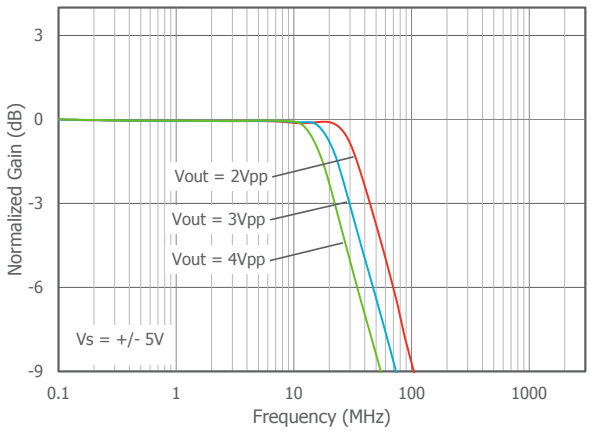

### APPLICATIONS

- Video driver
- Video surveillance and distribution
- A/D driver
- Active filters
- CCD imaging systems
- CD/DVD ROM
- Coaxial cable drivers
- High capacitive load driver
- Portable/battery-powered applications
- Twisted pair driver
- Telecom and optical terminals

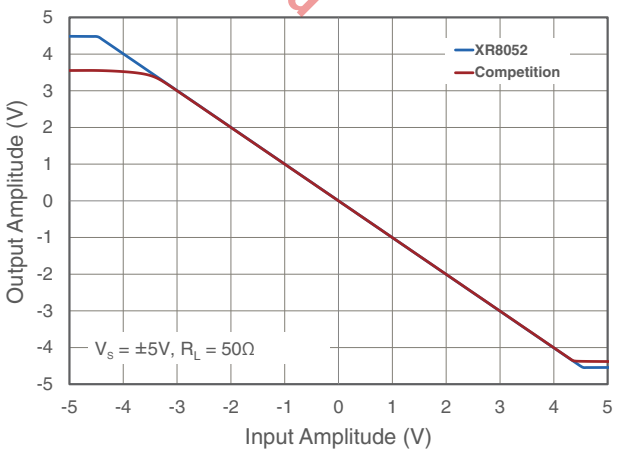

Ordering Information - page 26

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

## Large Signal Frequency Response

## Output Voltage Swing vs Competition

© 2007-2014 Exar Corporation

## Absolute Maximum Ratings

Stresses beyond the limits listed below may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

$V_S$ ..... 0V to +14V

$V_{IN}$ ..... $-V_S$ - 0.5V to $+V_S$ +0.5V

## Operating Conditions

Supply Voltage Range .....2.7 to 12.6V

Operating Temperature Range .....-40°C to 125°C

Junction Temperature .....150°C

Storage Temperature Range.....-65°C to 170°C

Lead Temperature (Soldering, 10s) .....260°C

## Package Thermal Resistance

$\theta_{JA}$ (TSOT-5).....215°C/W

$\theta_{JA}$ (SOIC-8).....150°C/W

$\theta_{JA}$ (MSOP-8) ..... 200°C/W

$\theta_{JA}$ (SOIC-14) ..... 90°C/W

$\theta_{JA}$ (TSSOP-14).....100°C/W

Package thermal resistance ($\theta_{JA}$), JEDEC standard, multi-layer test boards, still air.

## ESD Protection

XR8051, XR8052, XR8054 (HBM) .....1kV

ESD Rating for HBM (Human Body Model).

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

## Electrical Characteristics at +3V

$T_A$ = 25°C, $V_S$ = +3V, $R_f$ = 1.5kΩ, $R_L$ = 2kΩ to $V_S$/2; G = 2; unless otherwise noted.

| Symbol | Parameter | Conditions | Min | Typ | Max | Units |

## Application Information

### General Description

The XR8051, XR8052, and XR8054 are single supply, general purpose, voltage-feedback amplifiers fabricated on a complementary bipolar process using a patent pending topography. They feature a rail-to-rail output stage and is unity gain stable.

The common mode input range extends to 300mV below ground and to 0.9V below $V_S$. Exceeding these values will not cause phase reversal. However, if the input voltage exceeds the rails by more than 0.5V, the input ESD devices will begin to conduct. The output will stay at the rail during this overdrive condition.

The design is short circuit protected and offers "soft" saturation protection that improves recovery time.

Figures 1, 2, and 3 illustrate typical circuit configurations for non-inverting, inverting, and unity gain topologies for dual supply applications. They show the recommended bypass capacitor values and overall closed loop gain equations. Figure 4 shows the typical non-inverting gain circuit for single supply applications.

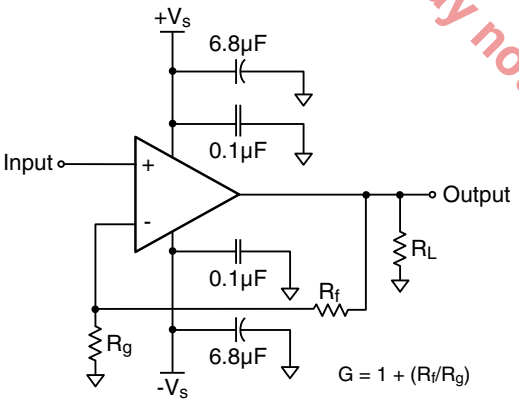

Figure 1: Typical Non-Inverting Gain Circuit

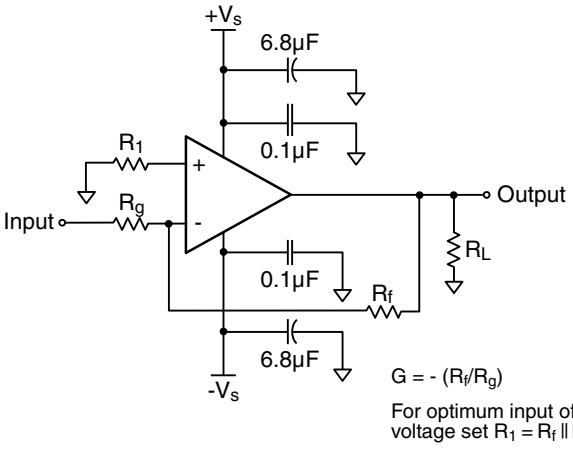

Figure 2: Typical Inverting Gain Circuit

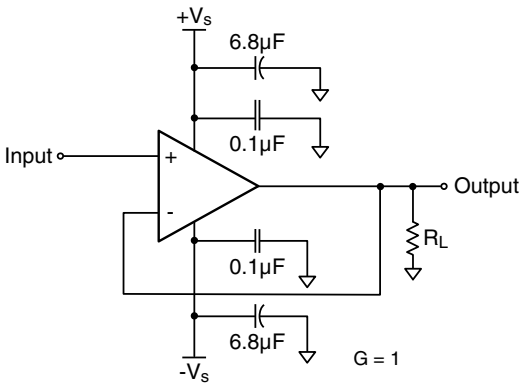

Figure 3: Unity Gain Circuit

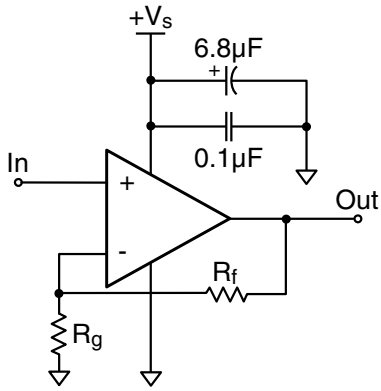

Figure 4: Single Supply Non-Inverting Gain Circuit

The product(s) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

### Overdrive Recovery

For an amplifier, an overdrive condition occurs when the output and/or input ranges are exceeded. The recovery time varies based on whether the input or output is overdriven and by how much the ranges are exceeded. The XR8051, XR8052, and XR8054 will typically recover in less than 20ns from an overdrive condition. Figure 5 shows the XR8052 in an overdriven condition.

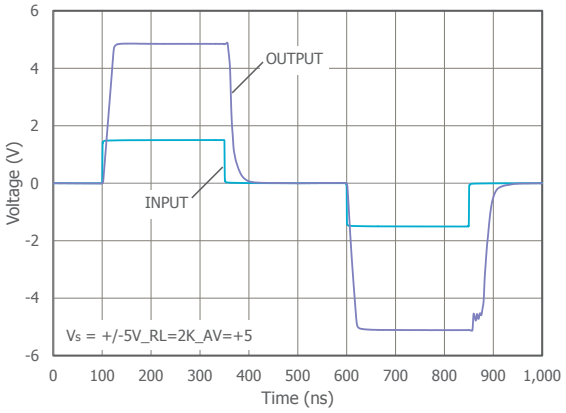

Figure 5: Overdrive Recovery

## Power Dissipation

Power dissipation should not be a factor when operating under the stated 2kΩ load condition. However, applications with low impedance, DC coupled loads should be analyzed to ensure that maximum allowed junction temperature is not exceeded. Guidelines listed below can be used to verify that the particular application will not cause the device to operate beyond it's intended operating range.

Maximum power levels are set by the absolute maximum junction rating of 170°C. To calculate the junction temperature, the package thermal resistance value Theta$_{JA}$ ($\theta_{JA}$) is used along with the total die power dissipation.

$$T_{Junction} = T_{Ambient} + (\theta_{JA} \times P_D)$$

Where $T_{Ambient}$ is the temperature of the working environment.

In order to determine $P_D$, the power dissipated in the load needs to be subtracted from the total power delivered by the supplies.

$$P_D = P_{supply} - P_{load}$$

Supply power is calculated by the standard power equation.

$$P_{supply} = V_{supply} \times I_{RMSsupply}$$

$$V_{supply} = V_{S+} - V_{S-}$$

Power delivered to a purely resistive load is:

$$P_{load} = ((V_{load})_{RMS}^2)/Rload_{eff}$$

The effective load resistor ($Rload_{eff}$) will need to include the effect of the feedback network. For instance,

$Rload_{eff}$ in Figure 3 would be calculated as:

$$R_L \parallel (R_f + R_g)$$

These measurements are basic and are relatively easy to perform with standard lab equipment. For design purposes however, prior knowledge of actual signal levels and load impedance is needed to determine the dissipated power. Here, $P_D$ can be found from

$$P_D = P_{Quiescent} + P_{Dynamic} - P_{load}$$

Quiescent power can be derived from the specified $I_S$ values along with known supply voltage, $V_{supply}$. Load power can be calculated as above with the desired signal amplitudes using:

$$(V_{load})_{RMS} = V_{peak} / \sqrt{2}$$

$$(I_{load})_{RMS} = (V_{load})_{RMS} / Rload_{eff}$$

The dynamic power is focused primarily within the output stage driving the load. This value can be calculated as:

$$P_{Dynamic} = (V_{S+} - V_{load})_{RMS} \times (I_{load})_{RMS}$$

Assuming the load is referenced in the middle of the power rails or $V_{supply}/2$.

The XR8051 is short circuit protected. However, this may not guarantee that the maximum junction temperature (+150°C) is not exceeded under all conditions. Figure 6 shows the maximum safe power dissipation in the package vs. the ambient temperature for the packages available.

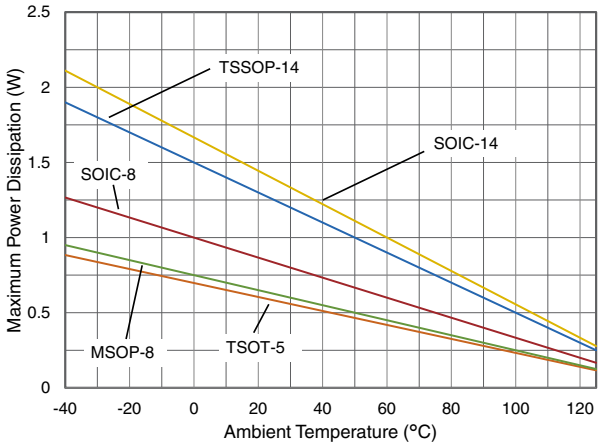

Figure 6. Maximum Power Derating

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

## Driving Capacitive Loads

Increased phase delay at the output due to capacitive loading can cause ringing, peaking in the frequency response, and possible unstable behavior. Use a series resistance, $R_S$, between the amplifier and the load to help improve stability and settling performance. Refer to Figure 7.

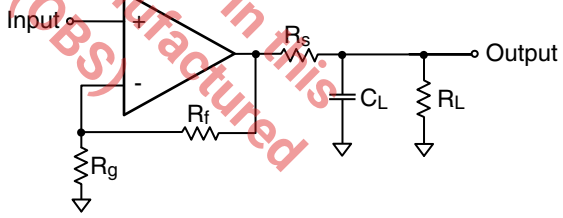

Figure 7. Addition of $R_S$ for Driving Capacitive Loads

Table 1 provides the recommended $R_S$ for various capacitive loads. The recommended $R_S$ values result in approximately <1dB peaking in the frequency response.

| $C_L$ (pF) | $R_S$ (Ω) | -3dB BW (MHz) |
|---|---|---|
| 22pF | 0 | 120 |
| 47pF | 15 | 80 |
| 100pF | 15 | 65 |
| 492pF | 6.5 | 40 |

Table 1: Recommended $R_S$ vs. $C_L$

For a given load capacitance, adjust $R_S$ to optimize the tradeoff between settling time and bandwidth. In general, reducing $R_S$ will increase bandwidth at the expense of additional overshoot and ringing.

## Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. Exar has evaluation boards to use as a guide for high frequency layout and as an aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8µF and 0.1µF ceramic capacitors for power supply decoupling
- Place the 6.8µF capacitor within 0.75 inches of the power pin
- Place the 0.1µF capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts below for more information.

The product(s) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)

## Evaluation Board Information

The following evaluation boards are available to aid in the testing and layout of these devices:

| Evaluation Board # | Products |
|---|---|
| CEB002 | XR8051 in TSOT |
| CEB003 | XR8051 in SOIC |
| CEB006 | XR8052 in SOIC |
| CEB010 | XR8052 in MSOP |
| CEB018 | XR8054 in TSSOP |

## Evaluation Board Schematics

Evaluation board schematics and layouts are shown in Figures 8-14 These evaluation boards are built for dual-supply operation. Follow these steps to use the board in a single-supply application:

1. Short $-V_S$ to ground.
2. Use C3 and C4, if the $-V_S$ pin of the amplifier is not directly connected to the ground plane.

## Revision History

| Revision | Date | Description |
|---|---|---|
| 1B (ECN 1451-05) | December 2014 | Reformat into Exar data sheet template. Updated ordering information table to include MTR and EVB part numbers. Updated thermal resistance numbers and package outline drawings. Updated typical small signal bandwidth specifications and plots. |

The product (or products) mentioned in this data sheet are no longer being manufactured and may not be ordered (OBS)
